Onchocerciasis is a parasitic disease, widely present in the North of Africa, caused by Onchocerca volvulus and transmitted by the "Simulidae" genus. There are 2 clinical forms of onchocerciasis, cutaneous and ocular onchocerciasis. Epidemiological studies in Tunisia revealed that the former is more common than the latter and that the prevalence is higher in the northern than in the southern regions. Two hundred and ten medical practitioners from three districts in the north and east of Tunisia (Tunis, Sfax, Sousse) were interviewed about their knowledge of, attitude towards and use of albendazole treatment of onchocerciasis. All the medical practitioners surveyed were found to be familiar with onchocerciasis and know its epidemiology, the source of infection and the risk factors for acquiring the disease. Very few knew that the disease is treatable. Only a third of the medical practitioners had treated patients for onchocerciasis. It is not clear if the degree of knowledge and the frequency of the use of albendazole treatment of onchocerciasis among the surveyed medical practitioners can be explained by the fact that the disease is endemic in the surveyed regions, because most of the medical practitioners who had treated patients for onchocerciasis knew that the disease was endemic in their districts, which is a
